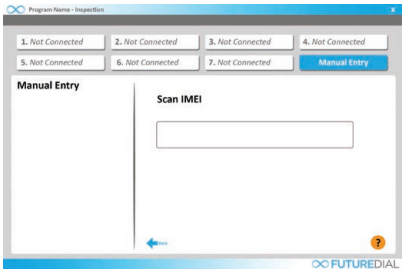
FUTUREDIAL

LOTUS

Lean One-Touch User System

Optimize your Process

Today's WMS and ERP systems were not designed to maximize operational efficiency. With continuing innovations in automation, WMS systems are struggling to keep up. Many organizations struggle to alter their systemic process steps due to system constraints. Additionally, supply chain operations often utilize multiple systems that further limit flexibility. FutureDial's LOTUS breaks these constraints by providing an overlay UI solution that simplifies your operational workflow to mold exactly what you want. This system then translates the data in the background to fulfill each background systems' needs. You can have a one step process with LOTUS that then fulfills your existing WMS's need to receive data as a multistep process in the background.



FEATURES & BENEFITS

Speed & Flexibility

- Maximize Automation based on system integrations
- Accommodates SLA changes
- Account for all product in-line, including exceptions
- Track and Monitor operator performance, productivity and quality

Efficiency

- Integrate with multiple systems
- Prompt testing based on previous response to eliminate redundant testing
- Provide single, consistent User Interface
- Easy Recognition of operator prompts
- Consistent Positive/Negative indicators
- Step-by-Step Operator interaction
- Conditional Logic
- Administrative Control, (Full package offering) update process and prompts without the need for engineering intervention.
- Provide Instructions to operator based on previous response

Integration

- Design optimum process and translate to various background systems (WMS/ERP)
- Integrates into the full FutureDial Lean One-Touch suite of automation
- Exact mold to your various business Models

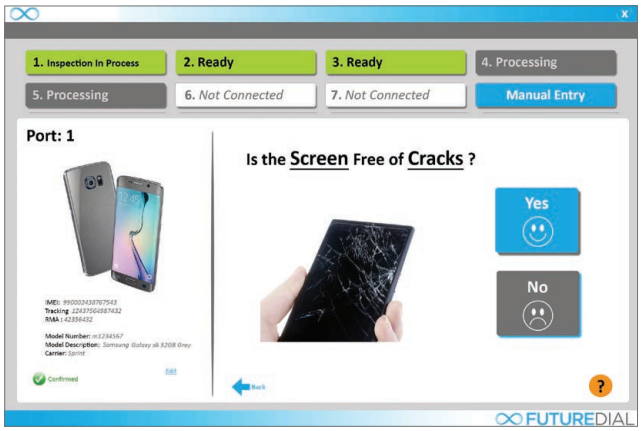
LOTUS
Lean One-Touch User System

Conditional Testing Eliminates Redundant Testing

FutureDial understands that business models contain many variables. LOTUS provides variable workflow logic that prompts testing by logical response. For business models that do not require full testing based on certain testing results, LOTUS makes the decision what testing to prompt based on your business rules.

Example: If the Touchscreen is shattered, why ask the operator if there are scratches on the Touchscreen?



Onscreen images assist in reducing the subjectivity of cosmetic prompts while speeding up operator recognition.

Empowering the Operator

Many organizations struggle with subjective testing criteria that are difficult for operators to attune to. Additionally, complicated work instructions are typically independent documents that are inconvenient for operators to access.

FutureDial has combined these ideologies into a step-by-step conditional UI that tells the operator exactly what to do and when to do it. Operators no longer need to memorize process steps, LOTUS takes that thought process away from the operator. System Logic makes decisions based on business rules and displays the decision to the operator.

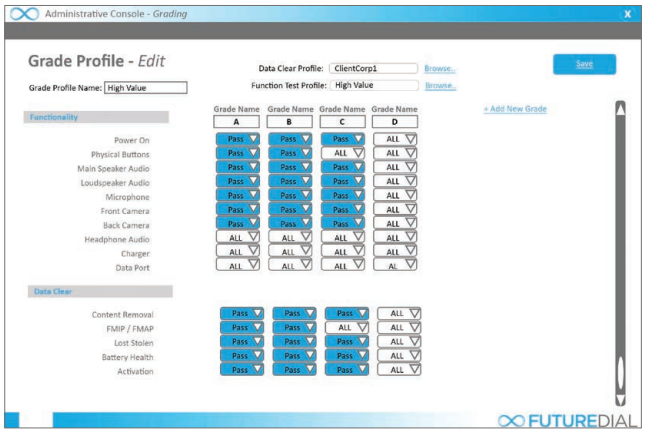
Standardize Product Condition with Automated Grading

Conditional grading is very important in the reverse logistics market. LOTUS has configurable grading rules that use the testing results and operator responses to select the appropriate grade automatically.

Administrative Controls empower you to define your exact grading criteria for various programs / products. Elect an option to stop testing if Grade has already been determined.



Account for all Product

LOTUS enables operators to account for everything that crosses their station within the same UI Screen. The system then handles & routes product based on your business rules.

Accommodate non-serialized product that arrives in your process. Accountability is key from both an inventory perspective as well as an operator's labor. Never lose visibility again with LOTUS. Know exactly what's flowing through your wall and who is handling it.

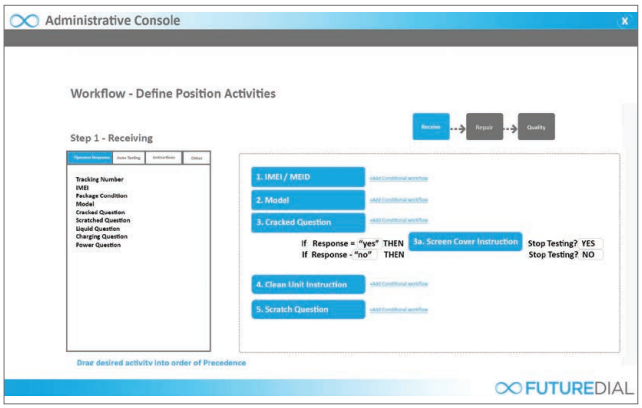
Design your Process

Never before has an admin been able to create and define a physical process within a software system. With our easy to use LOTUS, FutureDial has revolutionized the amount of Control an organization has over their physical process.



Exceptions Handling

Flag exceptions automatically when possible; enable the operator to easily flag as needed.
